The plant teams recorded 39 locations of invasive species. There was not a specific team looking for invasives to separate those locations from the other plants. However, the species codes were selected and the following map shows the locations.

Because some of the teams had problems with their GPS units while in deep forest or along the cliffs, locations were assigned based on either (1) a predetermined lat/long for the zone, or (2) the previously recorded GPS by that team if there was not a lat/long for that record. Therefore, it is possible that some of the locations for the invasives are not exact. Future bioblitzes or monitoring projects should keep invasives as a separate taxa reporting team.

It was noted that Poison oak was along the beach and English ivy climbing up trees was obvious north of Salmon beach.
